

When programming the control unit for the headlights with the AIC part number 59799 for BMW, the following steps should be performed so that it works smoothly:

**1 Teach-in of a control unit:**

- » Switch off the engine and lock the vehicle for approx. 3 minutes. When the vehicle enters the idle mode, remove the defective control unit and install the new one directly.

**2 Teach-in of two control units:**

- » Switch off the engine and lock the vehicle for approx. 3 minutes. When the vehicle enters the idle mode, remove the right defective control unit (passenger side).
- » Install the new control unit on the right headlight (passenger side).
- » Start the vehicle and switch the light switch 3 times within 2 seconds between position "0" and "Parking Light". Finally, the switch must remain in the "0" position.

- » Switch to "Parking Light". When the light lights up normally, the exchange was successful. If this is not the case, repeat step 1 to 3.
- » Switch off the engine and lock the vehicle for three minutes. Then mount the left control unit (driver's side).

**NOTICE**

If a control unit for the headlight has to be replaced, it is essential to ensure that the vehicle is not in operation and has been locked for at least 3 minutes.
